

Oral steroids

For the growth of power indicators in a short time and other achievements in bodybuilding, athletes successfully **use oral steroids**. They act like anabolics and androgens. As a result of steroid courses against the background of taking pills, muscles grow quickly and the athlete becomes stronger. In addition, anabolic steroids in tablets increase the efficiency of the bodybuilder and make him more enduring. The number of red blood cells increases, bone tissue strengthens and develops, and fatty deposits decrease.

Advantages of steroids in tablets

Against the background of the reception of these funds, the appetite increases and self-confidence develops. The athlete increases self-esteem and improves his ability to communicate, increases sexual attraction.

For those who are just beginning to engage in **bodybuilding**, tableted steroids will be the best choice - they are easy to use. In addition, many athletes do not tolerate injections, and here oral preparations will be a real salvation.

The obvious advantage of such drugs is the speed and the same rapid withdrawal of tablets from the body, without a trace. On average, their life expectancy is twenty-four hours. Therefore, oral anabolic steroids are most often taken every day. So it becomes possible to maintain a sufficient level of active substance in the blood.

Such drugs are rather difficult to detect during doping control - this is their obvious plus. Before competitions and checks such means will not be revealed in an organism of the sportsman.

Effects of anabolic and steroids in tablets

- Intensive growth of muscle mass;
- Stamina increases significantly;
- Increased strength;
- Performance in training is much greater;
- Red blood cells are produced at a rapid rate;
- Bone tissue becomes stronger;
- Fast and impressive decrease in fat reserves.

Of the additional effects should be allocated a high level of self-esteem and increased libido, as well as self-confidence.

The best oral steroids

There are many different drugs-anabolics. Here is a list of oral steroids that are popular with athletes:

- Methandrostenolone / methandienone;
- Oxandrolone;

- Proviron;
- Oxymetholone;
- Oral-Turinabol;
- Stanozolol.

How do I take oral steroids?

For beginners, it is best to first take a short **course of oral steroids** - enough six weeks of the cycle. During this time you can learn the reaction of the body and draw conclusions about how to proceed. If the bodybuilder first tries hormonal doping, then the main thing is the correct dosages, then the results will be excellent even in the case of minimal doses of soft anabolic steroids.

Buy oral steroids you can always in a specialized store at affordable prices. Only high-quality preparations are offered here. Fakes are excluded. It's enough just to make an order, and soon you will be delivered this or that remedy. To achieve the best results in sports you will be helped by safe oral steroids.

Steroid courses should not exceed three months. In addition, as much after the end of the cycle you need to take a break. After taking anabolic steroids, it is appropriate to conduct PCT. With the help of such therapy it is possible to save all the results obtained for the course, to restore the hormonal background. In addition, post-course therapy protects the body from pobokachek after a steroid course. In order not to rollback, Clenbuterol will be an excellent assistant.

Buy steroids in tablets you can in the store at reasonable prices. With the right dosages, there will not be any side effects.

Half-life of oral steroids

In the manufacture of a tablet form, another method is used to increase the half-life. The main problem with tablets is that no steroid in its pure form is able to pass through the gastrointestinal tract, the digestive enzymes of which rapidly destroy the drug.

To avoid this, a molecule CH₄ is added to each molecule of the steroid at position 17-a. This method is called alkylation, the preparations thus obtained are 17-alkylated. It should also be noted that the addition of the CH₄ molecule enhances the anabolic properties of the drug.

All oral steroids are subjected to alkylation except parabolon. Means that have undergone alkylation are rapidly destroyed in the liver and have a non-prolonged half-life. On average, it is from 3 to 12 hours. Also, for half-life, the working capacity of the liver also exerts a great influence. Therefore, tableted steroids need to be consumed much more often than injected steroids, and most often do it for 2 or 4 doses during the day.

It should be noted that although all drugs that have been alkylated and are intended for oral use are available both in the form of tablets and as suspensions, the latter are a suspension of crystals in water. In this form, injection methane and stanozole are produced.

Steroids in the form of suspensions are much stronger than tableted and yet have local action properties. In simpler terms, they are able to stimulate the growth of muscle tissue in the place

where they were injected. This was made possible by the creation of a high concentration of active substances.

The strongest and most powerful oral steroid

It's about **oxymetholone**. Such a drug is not allowed to take more than a month. This tool appeared for the first time in Mexico. It was 1960, at the same time the drug was released massively thanks to the American company Syntex with the trademark Anadrol-50.

It is best to take this drug, dividing the daily intake into two equal dosages - drink tablets in the morning and before bedtime, in the evening. The half-life of the drug is from seven to fifteen hours. Dosage - no more than three or four tablets.

The best steroids in tablets for muscle mass

- **Danabol or just methane** . In bodybuilding, methandrostenolone / methandienone is used to create anabolic combinations, the mass gained from the solo course is mostly in the liquid. In an ensemble with other drugs, this steroid increases muscle mass and gives a more pronounced effect, minimizing the spillage of aromatization.
- **Turinabol** is a mild version of methandrostenolone, a powerful version of it, which excludes side effects in the form of fluid retention in the body. The drug gives a dry muscle mass and increases physical performance.
- **Oxymetholone** - a powerful oral steroid, the effect of using it is a huge pumping, muscle growth. This remedy removes pain in the joints and increases stamina.

Oral steroids are more rapid in action than injecting, and their life is shorter. They act very quickly, and do not stay long in the body of the athlete. Tablet anabolic steroids are often taken, but they are very simple to use, quite practical.

A very important fact is that **oral anabolics** are more difficult to detect during doping tests due to the fact that they are quickly eliminated from the body. This type of steroid anabolic is more preferable for beginners and those who are afraid of injections, as well as for athletes before doping test.

Such tools are easy to store - for this dry place, protected from direct sun rays, is suitable. Storage temperature should be normal. When choosing oral steroids, pay attention to well-known brands. such funds have been tested for quality, they are safe for your health and meet world standards, for efficiency at altitude. In order not to get a fake, you should not buy drugs with hands - contact a specialized store.
